# 1 About this guide

This guide provides basic guidelines for Rosemount 2051G Transmitters. It does not provide instructions for configuration, diagnostics, maintenance, service, troubleshooting, Explosion-proof, Flameproof, or intrinsically safe (I.S.) installations. See the Rosemount 2051G Reference Manual for more information.

### **A WARNING**

## Explosions could result in death or serious injury.

Installation of these transmitters in an explosive environment must be in accordance with the appropriate local, national, and international standards, codes, and practices. Review the approvals section of the Rosemount 2051 Reference Manual for any restrictions associated with a safe installation.

Before connecting a HART-based communicator in an explosive atmosphere, make sure the instruments in the loop are installed in accordance with intrinsically safe or non-incendive field wiring practices.

In an explosion-proof/flameproof installation, do not remove the transmitter covers when power is applied to the transmitter.

## Process leaks could result in death or serious injury.

To avoid process leaks, only use the O-ring designed to seal with the corresponding flange adapter.

# Electrical shock could cause death or serious injury.

Avoid contact with the leads and terminals. High voltage that may be present on leads can cause electrical shock.

#### Conduit/cable entries

Unless marked, the conduit/cable entries in the housing use a 1/2-14 NPT thread form. Entries marked M20 are M20 × 1.5 thread form. On devices with multiple conduit entries, all entries will have the same thread form. Only use plugs, adapters, glands, or conduit with a compatible thread form when closing these entries.

## **WARNING**

### **Physical access**

Unauthorized personnel may potentially cause significant damage to and/or misconfiguration of end users' equipment. This could be intentional or unintentional and needs to be protected against.

Physical security is an important part of any security program and fundamental in protecting your system. Restrict physical access by unauthorized personnel to protect end users' assets. This is true for all systems used within the facility.

## **A WARNING**

Refer to the *Product certifications* section of this Quick Start Guide documentation when using the RFID tag (option code Y3) for required installation conditions.

# 2 System readiness

# 2.1 Confirm HART Revision capability

- If using HART® based control or asset management systems, confirm the HART capability of those systems prior to transmitter installation. Not all systems are capable of communicating with HART Revision 7. This transmitter can be configured for either HART Revision 5 or 7.
- For instructions on how to change the HART revision of the transmitter, see <u>Switch HART revision mode</u>.

## 2.2 Confirm correct device driver

#### **Procedure**

- Verify the latest Device Driver (DD/DTM<sup>™</sup>) is loaded on your systems to ensure proper communications.
- 2. Reference Emerson.com or FieldCommGroup.org for the latest DD.
- 3. Select desired product and download the DD.
  - a) Reference <u>Table 2-1</u> for the correct DD.

Table 2-	1. Davica	<b>Revisions</b>	and Files
Table 2-	1: Device	Revisions	and riles

	Identify device		Find devi files	ce driver	Review instructions	Review functiona lity	
Softwar e release date	NAMUR hardwa re revision	NAMUR softwar e revision	HART softwar e revision	HART univers al revision	Device revision	00809-04 00-4101	Changes to software <sup>(4</sup>
June	1.1.xx	1.0.xx	03	7	10	Reference	(4)
2016				5	9	<u>Manual</u>	

- (1) NAMUR revision is located on the hardware tag of the device. Differences in level 3 changes, signified above by xx, represent minor product changes as defined per NE53. Compatibility and functionality are preserved and product can be used interchangeably.
- (2) HART software revision can be read using a HART capable configuration tool. Value shown is minimum revision that could correspond to NAMUR revisions.
- (3) Device driver file names use device and DD revision (e.g. 10\_01). HART Protocol is designed to enable legacy device driver revisions to continue to

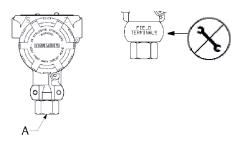

communicate with new HART devices. To access new functionality, the new device driver must be downloaded. It is recommended to download new device driver files to ensure full functionality.

(4) HART Revision 5 and 7 selectable, Local Operator Interface (LOI), scaled variable, configurable alarms, expanded engineering units. Updated electronics hardware design. Intrinsically Safe temperature classification change.

# 3 Mount the transmitter

Mount directly to the impulse line without using an additional mounting bracket or mount directly to a wall, panel, or two-inch pipe using an optional mounting bracket.

**Figure 3-1: Transmitter Direct Mounting** 

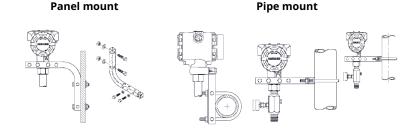

#### A. Process connection

#### Note

Do not apply torque directly to the electronics housing. To avoid damage, apply torque only to the hex-shaped process connection.

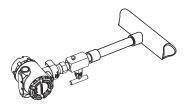

Figure 3-2: Panel and Pipe Mounting

# 3.1 Liquid flow applications

#### **Procedure**

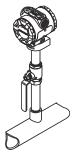

- 1. Place taps to the side of the line.
- 2. Mount beside or below the taps.
- 3. Mount the transmitter so the drain/vent valves are oriented upward.

# 3.2 Gas flow applications

#### **Procedure**

- 1. Place taps in the top or side of the line.
- 2. Mount level or above the taps.

# 3.3 Steam flow applications

#### **Procedure**

- 1. Place taps to the side of the line.
- 2. Mount beside or below the taps.
- 3. Fill impulse lines with water.

# 3.4 Environmental seal for housing

Thread sealing (PTFE) tape or paste on male threads of conduit is required to provide a water/dust tight conduit seal and meets requirements of NEMA® Type 4X, IP66, and IP68. Consult factory if other ingress protection ratings are required.

For M20 threads, install conduit plugs to full thread engagement or until mechanical resistance is met.

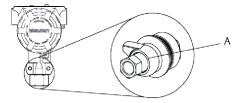

# 3.5 Gage transmitter orientation

The low side pressure port (atmospheric reference) on the inline gage transmitter is located in the neck of the transmitter, behind the housing. The vent path is 360° around the transmitter between the housing and sensor. (See Figure 3-3).

## **A** CAUTION

Keep the vent path free of any obstruction, including but not limited to paint, dust, and lubrication by mounting the transmitter so the contaminants can drain away.

Figure 3-3: Gage Low Side Pressure Port

**A** Low side pressure port (atmospheric reference)

# 4 Set the switches

Set alarm and security switch configuration before installation as shown in Figure 4-1.

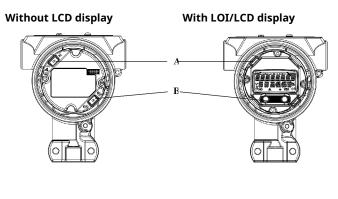

- The alarm switch sets the analog output alarm to high or low.
   Default alarm is high.
- The security switch allows ( ) or prevents ( ) any configuration of the transmitter. Default security is off ( ).

Use the following procedure to change the switch configuration:

#### **Procedure**

- 1. If the transmitter is installed, secure the loop, and remove power.
- 2. Remove the housing cover opposite the field terminal side. Do not remove the instrument cover in explosive atmospheres when the circuit is live.
- 3. Slide the security and alarm switches into the preferred position using a small screwdriver.
- 4. Reattach the transmitter cover. The cover must be fully engaged to comply with explosion-proof requirements.

Figure 4-1: Transmitter Electronics Board

- A. Alarm
- B. Security

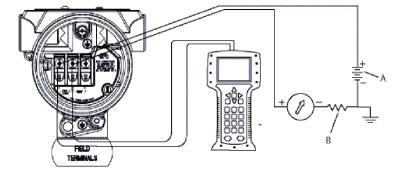

# 5 Connect the wiring and power up

## **A** CAUTION

Do not tamper with or remove the electronics board in the Rosemount<sup>™</sup> 2051G. This will cause permanent damage to the transmitter.

Shielded twisted pair cable should be used for best results. Use 24 AWG or larger wire that does not exceed 5000 ft. (1500 m) in length. If applicable, install wiring with a drip loop. Arrange the drip loop so the bottom is lower than the conduit connections and the transmitter housing.

Figure 5-1: Wiring the Transmitter (4–20 mA HART)

- A Vdc supply
- **B**  $R_L \ge 250$  (necessary for HART® communication only)

## **A** CAUTION

Installation of the transient protection terminal block does not provide transient protection unless the transmitter case is properly grounded.

Do not run signal wiring in conduit or open trays with power wiring, or near heavy electrical equipment.

Do not connect the powered signal wiring to the test terminals. Power could damage the test diode in the terminal block.

Use the following steps to wire the transmitter:

#### **Procedure**

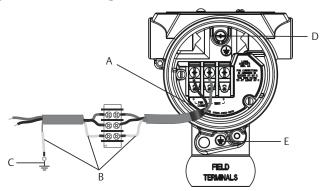

- 1. Remove the housing cover on the FIELD TERMINALS side.
- 2. Connect the leads as shown in <u>Figure 5-1</u>.
- 3. Tighten the terminal screws to ensure full contact with the terminal block screw and washer. When using a direct wiring method, wrap wire clockwise to ensure it is in place when tightening the terminal block screw.

#### Note

The use of a pin or ferrule wire terminal is not recommended as the connection may be more susceptible to loosening over time or under vibration.

- 4. Ground housing to fulfill local grounding regulations.
- 5. Ensure proper grounding. It is important that the instrument cable shield:
  - Be trimmed close and insulated from touching the transmitter housing
  - Be connected to the next shield if cable is routed through a junction box
  - Be connected to a good earth ground at the power supply end
- 6. If transient protection is needed, refer to <u>Grounding for</u> <u>transient terminal block</u> section for grounding instructions.
- 7. Plug and seal unused conduit connections.
- 8. Replace the housing cover.

Figure 5-2: Grounding

- A. Trim shield and insulate
- B. Insulate shield
- C. Terminate cable shield drain wire to earth ground
- D. Internal ground location
- E. External ground location

# 5.1 Grounding for transient terminal block

Ground termination is provided on the outside of the electronics housing and inside the terminal compartment. These grounds are used when the transient protection terminal blocks are installed. It is recommended that 18 AWG or larger wire is used to connect housing ground to earth ground (internal or external).

If the transmitter is currently not wired for power up and communication, follow <u>Connect the wiring and power up</u>. When the transmitter is properly wired, refer to <u>Figure 5-2</u> for internal and external transient grounding locations.

# 6 Verify transmitter configuration

Verify the configuration using any HART® capable configuration tool or LOI - option code M4. Configuration instructions for a Field Communicator and LOI are included in this step. See Rosemount™ 2051 Reference Manual for configuration instructions using AMS Device Manager.

# 6.1 Verifying configuration with a Field Communicator

A Rosemount™ 2051 DD must be installed on the Field Communicator to verify configuration. Fast Key sequences vary depending on device and DD revisions. Use the <u>Determine Fast Key sequence table</u> process below to identify the appropriate Fast Key sequences.

# 6.2 Field Communicator user interface

## 6.2.1 Determine Fast Key sequence table

#### **Procedure**

- Connect Field Communicator to Rosemount<sup>™</sup> 2051G.
- 2. If *Home* screen matches <u>Figure 6-1</u>, refer to <u>Table 6-1</u> for Fast Key sequences.
- 3. If *Home* screen matches <u>Figure 6-2</u>:
  - a) Perform Fast Key sequence 1, 7, 2 to identify Field Revision and HART® Revision.
  - Refer to <u>Table 6-2</u> and the appropriate column based on your Field Revision and HART Revision for Fast Key sequences.

#### Note

Emerson recommends installing the latest DD to access the complete functionality. Visit <a href="mailto:Emerson.com">Emerson.com</a> or <a href="mailto:FieldCommGroup.org">FieldCommGroup.org</a>.

Figure 6-1: Traditional Interface

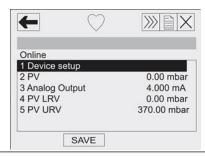

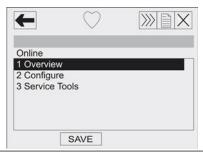

Figure 6-2: Device Dashboard

#### Note

A check ( $\checkmark$ ) indicates the basic configuration parameters. At minimum, these parameters should be verified as part of the configuration and startup procedure.

# 6.3 Verifying configuration with LOI

Simulate Digital Signal

The optional LOI can be used for commissioning the device. The LOI is a two-button design with internal and external buttons. The internal buttons are located on the display of the transmitter, while the external buttons are located underneath the top metal tag. To activate the LOI, push any button. LOI button functionality is shown on the bottom corners of the display. See <u>Table 6-3</u> and <u>Figure 6-4</u> for button operation and menu information.

Figure 6-3: Internal and External LOI Buttons

- A. Internal buttons
- B. External buttons

#### Note

See Figure 7-1 to confirm external button functionality.

**Table 6-3: LOI Button Operation** 

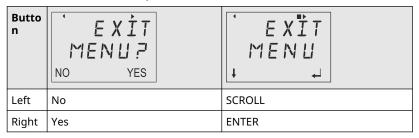

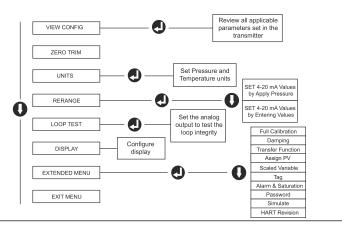

Figure 6-4: LOI Menu

#### 6.3.1 Switch HART revision mode

If the HART configuration tool is not capable of communicating with HART® Revision 7, the Rosemount™ 2051G will load a *Generic Menu* with limited capability. The following procedures will switch the HART revision mode from the *Generic Menu*:

#### **Procedure**

## $\textbf{Manual Setup} \rightarrow \textbf{Device Information} \rightarrow \textbf{Identification} \rightarrow \textbf{Message}$

- To change to HART Revision 5, Enter: "HART5" in the Message field.
- b) To change to HART Revision 7, Enter: "HART7" in the Message field.

# 7 Trim the transmitter

Devices are calibrated by the factory. Once installed, it is recommended to perform a zero trim on gage and absolute transmitters to eliminate error due to mounting position or static pressure effects. A zero trim can be performed using either a Field Communicator or configuration buttons.

For instructions using AMS Device Manager, see the Rosemount™ 2051 Reference Manual.

#### Note

When performing a zero trim, ensure the equalization valve is open and all wet legs are filled to the correct level.

### **A** CAUTION

It is not recommended to zero an absolute transmitter

#### **Procedure**

Select trim procedure.

- a) Analog Zero Trim Sets the analog output to 4 mA.
  - Also referred to as a "rerange," it sets the Lower Range Value (LRV) equal to the measured pressure.
  - The display and digital HART output remains unchanged.
- b) Digital Zero Trim Recalibrates the sensor zero.
  - The LRV is unaffected. The pressure value will be zero (on display and HART output). 4 mA point may not be at zero.
  - This requires that the factory calibrated zero pressure is within a range of three percent of the URV [0 ± 3% x URV].

# 7.1 Example

URV = 150 psi

Applied Zero Pressure =  $+0.03 \times 150$  psi = +4.5 psi (compared to factory settings) values outside this range will be rejected by the transmitter

# 7.2 Trimming with a Field Communicator

#### **Procedure**

Connect the Field Communicator, see <u>Connect the wiring and power up</u> for instructions.

2. Follow the HART menu to perform the desired zero trim.

Table 7-1: Zero Trim Fast Keys

	Analog zero (set 4 mA)	Digital zero
Fast Key Sequence	3, 4, 2	3, 4, 1, 3

# 7.3 Trimming with configuration buttons

A zero trim is to be performed using one of the three possible sets of external configuration buttons located under the top tag.

To access the configuration buttons, loosen the screw and slide the tag on the top of the transmitter. Confirm the functionality using <u>Figure 6-3</u>.

Figure 7-1: External Configuration Buttons

- A. Configuration buttons
- B. LOI
- C. Analog zero and span
- D. Digital zero

Use the following procedures to perform a Zero Trim:

# 7.3.1 Perform trim with LOI (option M4)

#### **Procedure**

- 1. Set the transmitter pressure.
- 2. See <u>Figure 6-3</u> for the operating menu.

- a) Select **Rerange** to perform an analog zero trim.
- b) Select **Zero Trim** to perform a digital zero trim.

## 7.3.2 Perform trim with analog zero and span (option D4)

#### **Procedure**

- 1. Set the transmitter pressure.
- 2. Press and hold the **zero** button for two seconds to perform an analog zero trim.

## 7.3.3 Perform trim with digital zero (option DZ)

#### **Procedure**

- 1. Set the transmitter pressure.
- Press and hold the **zero** button for two seconds to perform a digital zero trim.

# 8 Safety instrumented systems

For safety certified installations, refer to the <u>Rosemount™</u> <u>2051G Reference Manual</u> for installation procedure and system requirements.

# 9 Product certifications

60 °C ≤  $T_a$  ≤ +70 °C)

## **Special Conditions for Safe Use(X)**

1. This device contains a thin wall diaphragm less than 1 mm thickness that forms a boundary between zone 0 (process connection) and zone 1 (all other parts of the equipment). The model code and datasheet are to be consulted for details of the diaphragm material. Installation, maintenance, and use shall take into account the environmental conditions to which the diaphragm will be subjected. The manufacturer's instructions for installation and maintenance shall be followed in detail to assure safety during its expected lifetime.

- 2. Flameproof joints are not intended for repair.
- Non-standard paint options may cause risk from electrostatic discharge. Avoid installations that could cause electrostatic build-up on painted surfaces, and only clean the painted surfaces with a damp cloth. If paint is ordered through a special option code, contact the manufacturer for more information.

# 9.11 Y3 ATEX/IECEx RFID tag approvals

Certificate IECEx EPS 15.0042X, EPS 15 ATEX 1 1011 X

Markings II 2G Ex ia IIC T6/T4 Gb, II 2D Ex ia IIC T80/T130C

Db

#### Conditions of certification

Maximum operating temperature: -58 °F (-50 °C) to +158 °F (+70 °C)

The RFID tags shall never be exposed to high electromagnetic field strengths according to IEC 60079-14.

Electrostatic charges shall be avoided. The tags shall never be used next to strong charge generating processes.

This table is proposed in accordance with the provision of SJ/T11364.

# **A WARNING**

## **Additional warnings**

The plastic enclosure may present a potential electrostatic ignition hazard.

RFID tag has limitations in ambient temperature and zone installation areas (Zones 1 & 21) as compared to the gauge.
