PREFACE

Thank you for purchasing SolaHD SCM-E-MBUS!

This user manual defines how to use the communication functions of SCM-E-MBUS. It also contains important safety instructions that must be followed during the installation and operation of the communication module. Before attempting to install the product, please read all safety, installation, operational warnings and instructions thoroughly.

You can also download the PDF version of this, and other documents, at www.solahd.com.

INTRODUCTION

The SCM Series of SolaHD Communication Modules provide connectivity to one or two SDN-D Series power supplies using popular industrial protocols. The SCM-E-MBUS model provides Modbus TCP protocol support and an embedded web server with a graphical user interface (GUI) for setup and monitoring of SDN-D power supply data and parameters using a standard web browser.

FEATURES

- Provides a means to connect up-to two SDN-D Power Supplies to a Modbus TCP network.
- Monitoring and setup from common browsers, including Google Chrome, Microsoft Edge, Apple Safari, and Mozilla Firefox.
- Uploading and downloading of parameters and alarm setpoints via Modbus TCP
- Dual Ethernet ports to accommodate different network configurations.
- Built-in thermal sensor to measure the device's internal temperature. Since the SCM self-heating is minimal, this sensor approximates the external ambient temperature.

WHAT'S INCLUDED

SCM-E-MBUS ships with the following items:

- 1 x SCM-E-MBUS Ethernet/IP Communication Module
- 2 x SCM-E-MBUS I2C cable
- SCM-E-MBUS Safety Instruction Sheet

ADDITIONAL REQUIREMENTS (NOT INCLUDED)

The following items/accessories not included in the SCM-E-MBUS package are also needed:

- Ethernet/RJ45 cable (shielded Cat6 or higher)
- Windows PC with Internet browser

COMPATIBLE DEVICES/APPLICATIONS

SCM-E-MBUS is compatible with the following SolaHD SDN-D power supplies:

- SDN1024100D version xx 06 10
- SDN2024100D version xx 05 16

The SCM-E-MBUS functions with a variety of any Modbus TCP client devices. The web server is compatible with most MS Windows-based Internet browsers, including Google Chrome, Microsoft Edge, and Mozilla Firefox.

SAFETY INSTRUCTIONS

CAUTION - Risk of personal injury and explosion hazard.

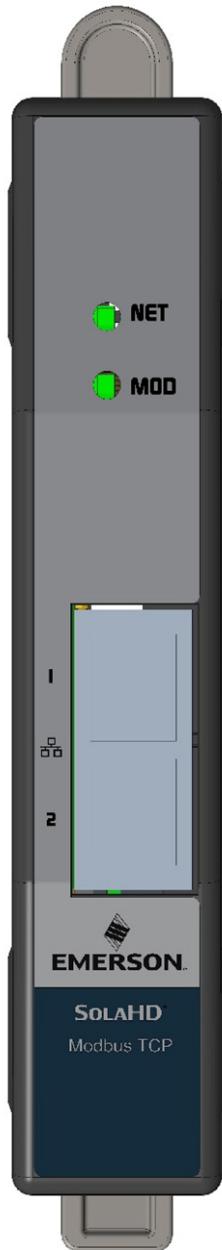

SAVE THESE INSTRUCTIONS - This manual contains important instructions that should be followed during installation and maintenance.

Risk of personal injury and explosion hazard when used in a Class I, Division 2/Class I, Zone 2 environment.

Refer to the "*Safety Instruction Sheet - SCM Communications Modules*" provided with the product or located on our website at www.SolaHD.com. Be sure to adhere to all safety procedures provided in the sheet.

1. PRODUCT OVERVIEW

1.1 GENERAL SPECIFICATIONS

Environmental	
Operating Temperature	-40°C to 70°C
Storage Temperature	-40°C to 85°C
Relative Humidity	5-95% RH
Altitude	0 to 3,000 m
Weight/Dimensions	
H x W x D	140 x 25.5 x 106.9 mm (5.51 x 1.00 x 4.20 in), with sliding arm 123.3 x 25.5 x 106.9 mm (4.85 x 1.00 x 4.20 in), without sliding arm
Net Weight	161g

1.2 COMMUNICATION SPECIFICATIONS

Item	Specification
Communication Protocol	Modbus TCP
Client/Server Role	Host PLC or PC act as Modbus TCP Client. SCM-E-MBUS act as Modbus TCP Server.
Topology	Star, Linear Bus, Ring
Transmission	One to one (unicast)
Transmission Speed	10Mbps, 100Mbps
Transmission Medium	Shielded Cat6 Twisted-pair cable
Maximum Transmission Distance	100 meters
Maximum number of Clients	4
Default IP Address	DHCP enabled
Server Port	502
Endianness	Little-Endian
Supports Function Codes	02 – Discrete Input 03 – Holding Register 04 – Input Register 06 – Write Single Register

1.3 CONSTRUCTION

The important parts of the SCM-E-MBUS Communication Module are as follows:

1.4 NETWORK AND MODULE STATUS INDICATORS

As shown in [Section 1.3](#), there are two LED indicators on the SCM-E-MBUS, one for Network and one for Module.

The table below defines the different status of both LED indicators.

LED Indicator	LED State	Summary	Definition
Module	Steady Off	No power	No power is supplied to the SCM.
	Steady Green	Device operational	Normal Operation.
	Flashing Red	Major Recoverable Fault	A Power Supply has a Major Recoverable Fault.
	Steady Red	Major Unrecoverable Fault	A Power Supply has a Major Unrecoverable Fault.
	Flashing Green / Red	Self-test	SCM is performing a self-test.
Network	Steady Off	Not powered, no IP address	The device is powered OFF or is powered ON but with no IP address configured.
	Flashing Green	No connections	An IP address is configured, waiting for first Modbus message.
	Steady Green	Connected	An IP address is configured, at least one Modbus message received.
	Flashing Red	Connection timeout	An IP address is configured, and no Modbus message has been received. This means the device connection has timed out.
	Steady Red	Duplicate IP	SCM has detected that its IP address is already in use.
	Flashing Green / Red	Self-test	SCM is performing a self-test.

1.4.1 INDICATORS AT POWER UP

The module performs several layers of initialization, including a check for a firmware change, network initialization, and power on self-test. A complete startup sequence takes about 10 seconds.

STEP 1: At power up, the Module Status Indicator turns GREEN momentarily, then RED momentarily, then continuous Green. In the same sequence, the Network Status Indicator turns GREEN momentarily, then RED momentarily, then OFF until the module completes network initialization.

STEP 2: When network initialization completes, the Module and Network Status indicator turns OFF for approximately 3 seconds.

STEP 3: The Module Status indicator turns GREEN momentarily, then RED momentarily, then continuous GREEN. The Network Status Indicator turns GREEN momentarily, then RED momentarily, then turns OFF.

The module is now operational.

1.5 SETUP AND CONNECTIVITY

1.5.1 ELECTROSTATIC DISCHARGE

NOTICE

Always use ESD precautions when handling electronic circuit equipment as they contain parts and assemblies susceptible to damage by electrostatic discharge (ESD).

Please take precautions to avoid product damage or data loss from ESD (Electrostatic Discharge).

- Transport the product within its static-safe packaging.
- Apply proper human grounding techniques (such as electrostatic wrist straps) before handling and installing the product.
- Ensure the installation environment (control cabinet or similar) is grounded and discharged before contact to with the product.

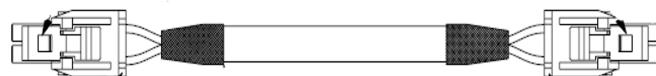

1.5.2 MODULE REPLACEMENT (POWER SUPPLY OR SCM)

To avoid any data corruption when changing one or both power supplies or SCM, it is recommended to follow these steps:

1. Remove input power from power supplies.
2. Perform equipment installation and removal while power is removed.
3. Connect communications and power wiring while equipment is de-energized.
4. Restore input power only after installation and wire connection are complete.

1.5.3 SOLAHD POWER SUPPLIES (SDN-D SERIES)

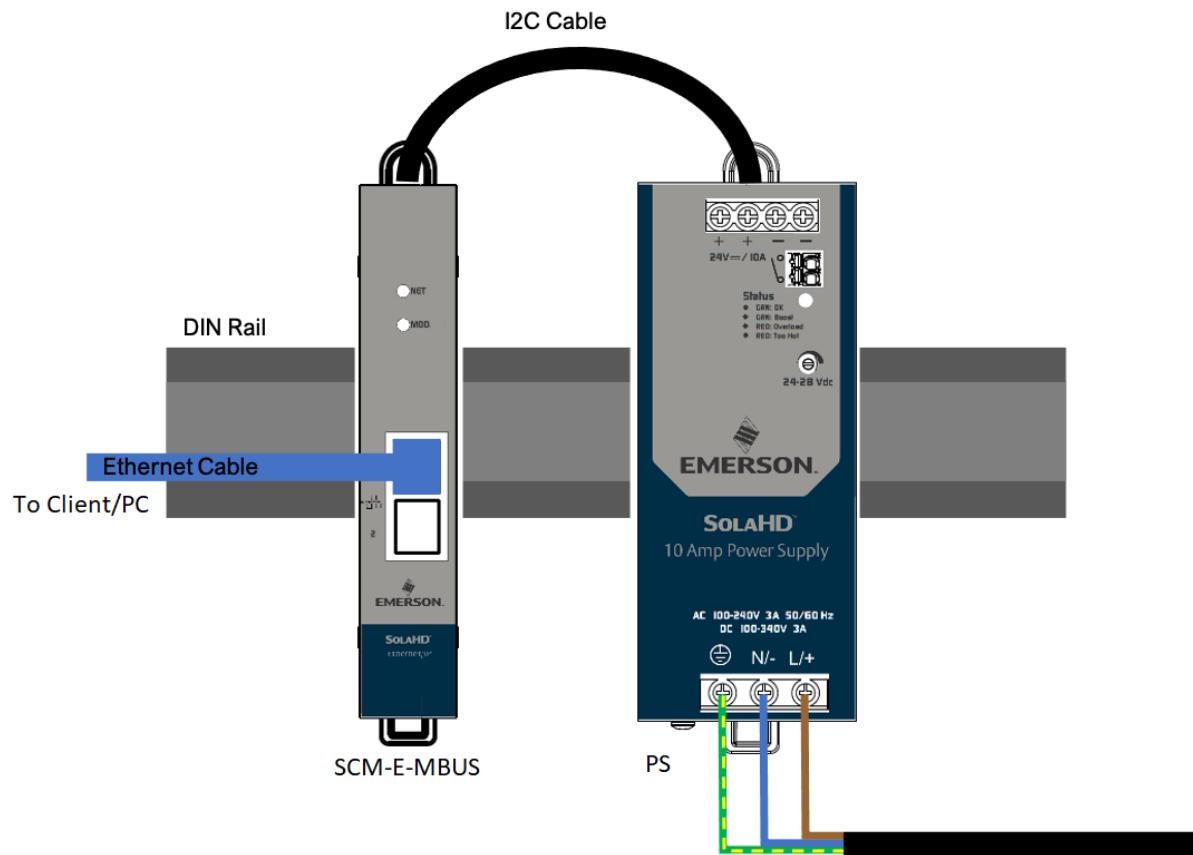

Each module (SCM-E-MBUS) includes 2 communication cables for connection of up to two SDN-D Power Supplies. Each cable connects from the port on top of a power supply to one of the 2 ports on the top of the SCM. The minimum configuration to attain an operating system includes input power, the SCM power supply cable and an Ethernet network connection to the RJ45 connector on front of the module. For the location of the I2C port, refer to [Section 1.3](#).

The sections below show the wiring of the SCM-E-MBUS to the SDN-D power supply.

1.5.3.1 WIRING: SCM-E-MBUS AND SDN-D 1:1 CONNECTION

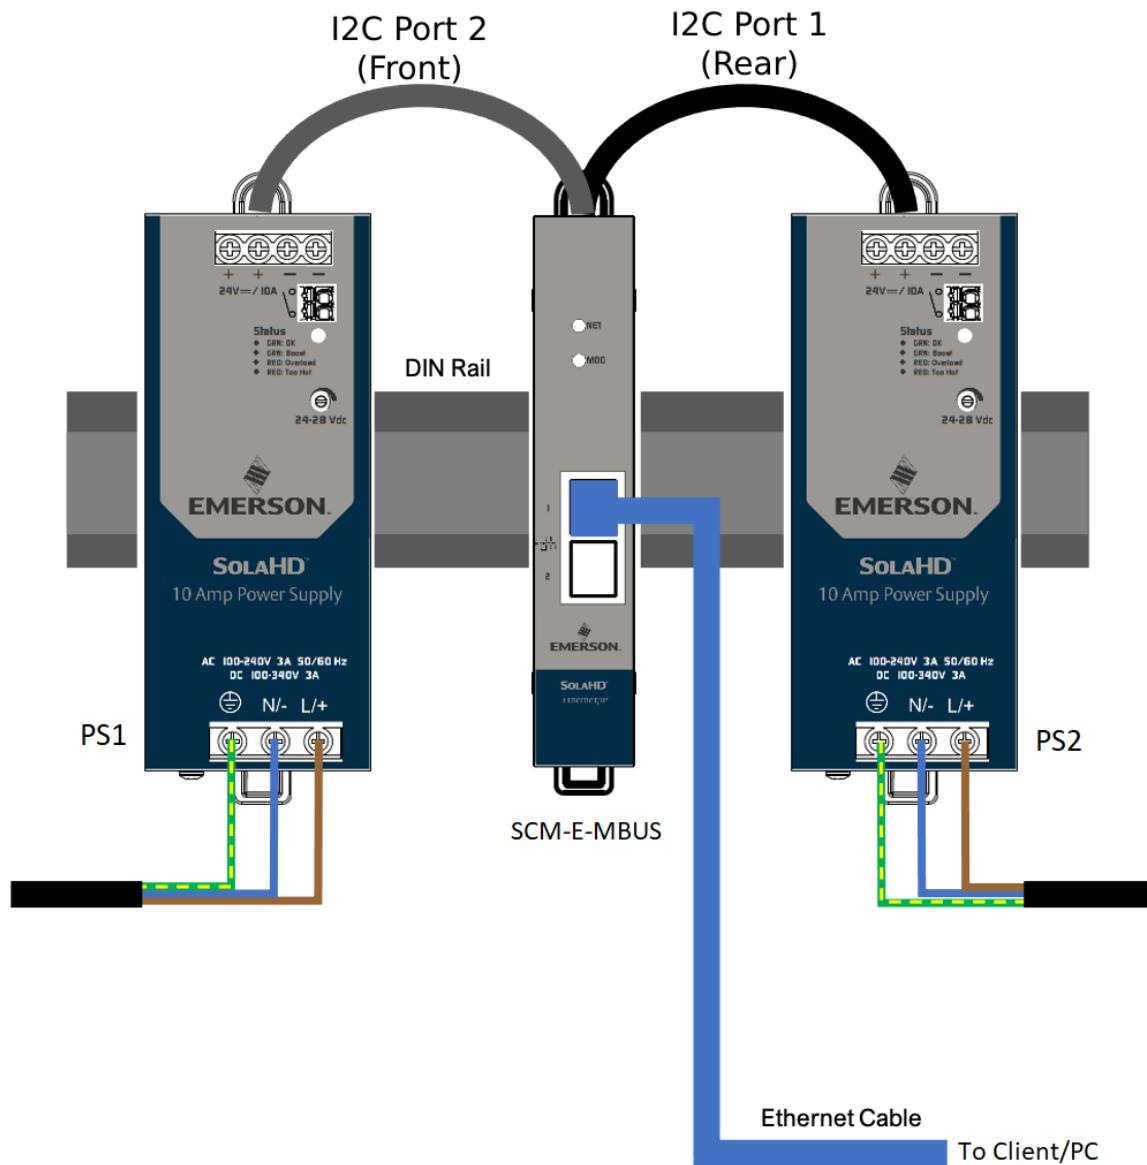

The set-up below shows typical connections of one SCM-E-MBUS to one SDN-D Power Supply.

1:1 Connection of SCM-E-MBUS to one SDN-10-24-100-D Power Supply

1.5.3.2 WIRING: SCM-E-MBUS AND SDN-D 1:2 CONNECTION

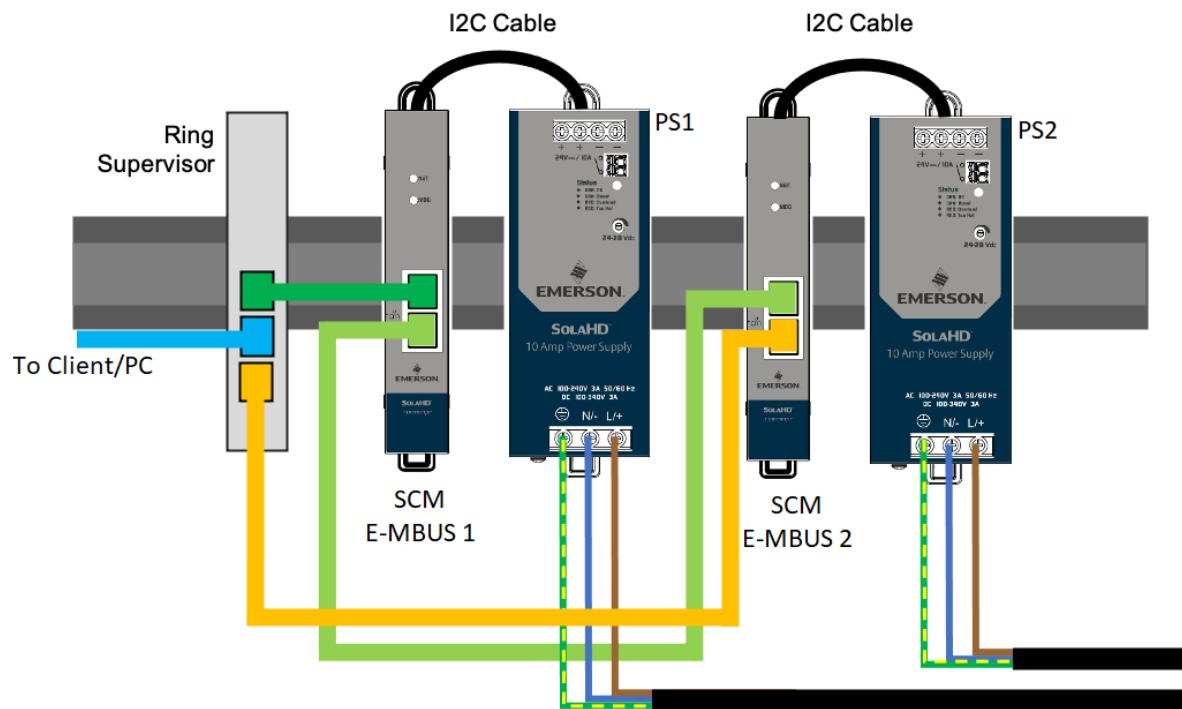

The set-up below shows typical connections of one SCM-E-MBUS to two SDN-D Power Supplies.

1:2 Connection of SCM-E-MBUS to Dual SDN-10-24-100-D Power Supplies

1.5.3.3 WIRING: SCM-E-MBUS AND SDN-D RING CONNECTION

A Ring topology enables interconnection of multiple automation devices without the need for additional switches. In effect, each Ethernet device has 2 RJ45 ports and an embedded single port switch, enabling continued communications under various adverse network conditions. The example below shows typical connections for 2 separate power supply subsystems operating on a ring network.

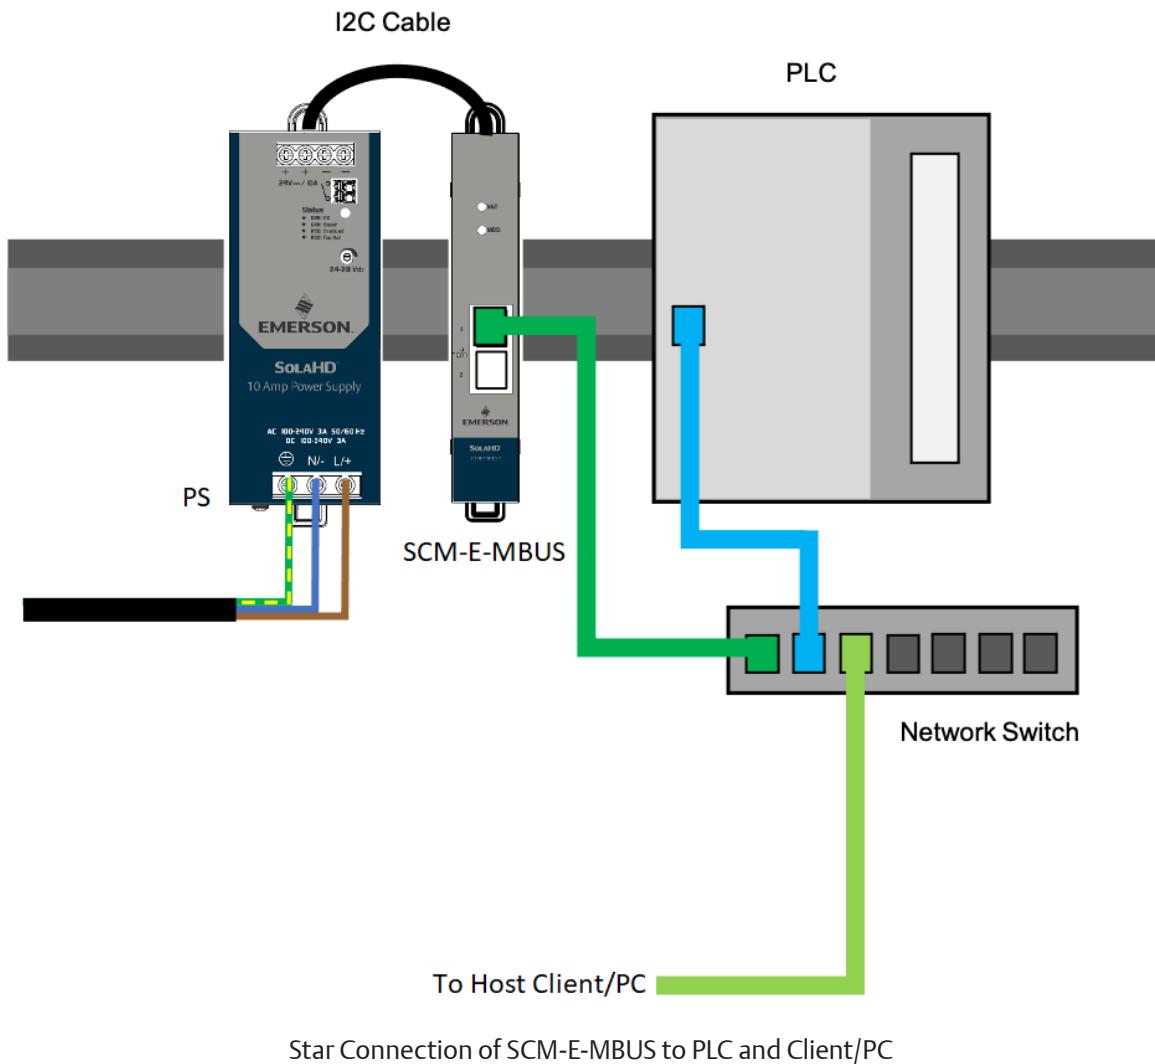

Ring Connection of SCM-E-MBUS to two separate Power Supplies

1.5.4 WIRING TOPOLOGY WITH MODBUS TCP CLIENT PLC

To connect a SolaHD SDN-D Power Supply to any PLC which supports Modbus TCP client, it must be wired either via a star topology or a ring topology as shown in the examples below. Both topologies make use of a network switch.

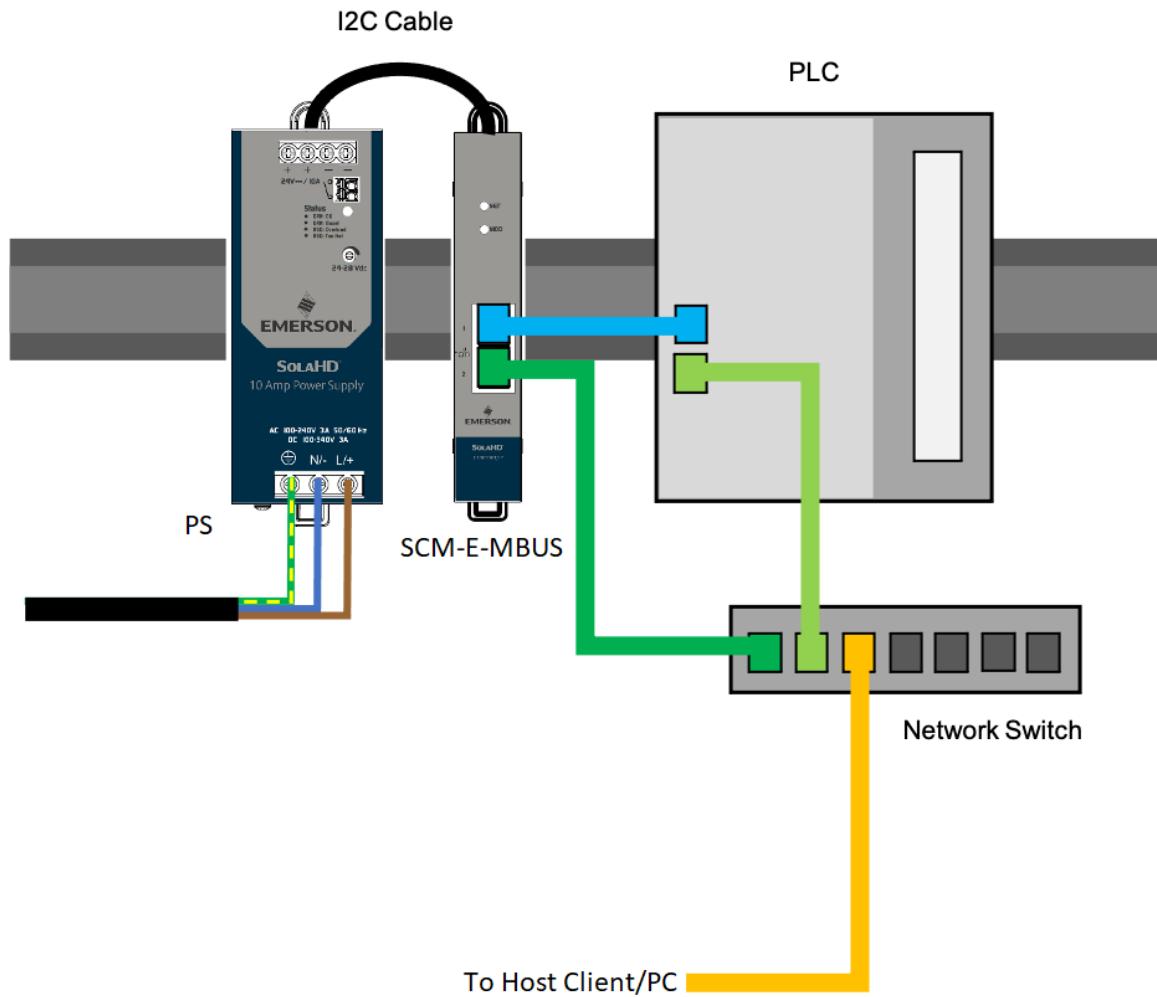

1.5.4.1 WIRING: PLC-MODBUS TCP CLIENT STAR TOPOLOGY

The set-up below shows the wiring of a SCM-E-MBUS - SDN-D Power Supply to a PLC which supports Modbus TCP client in star topology.

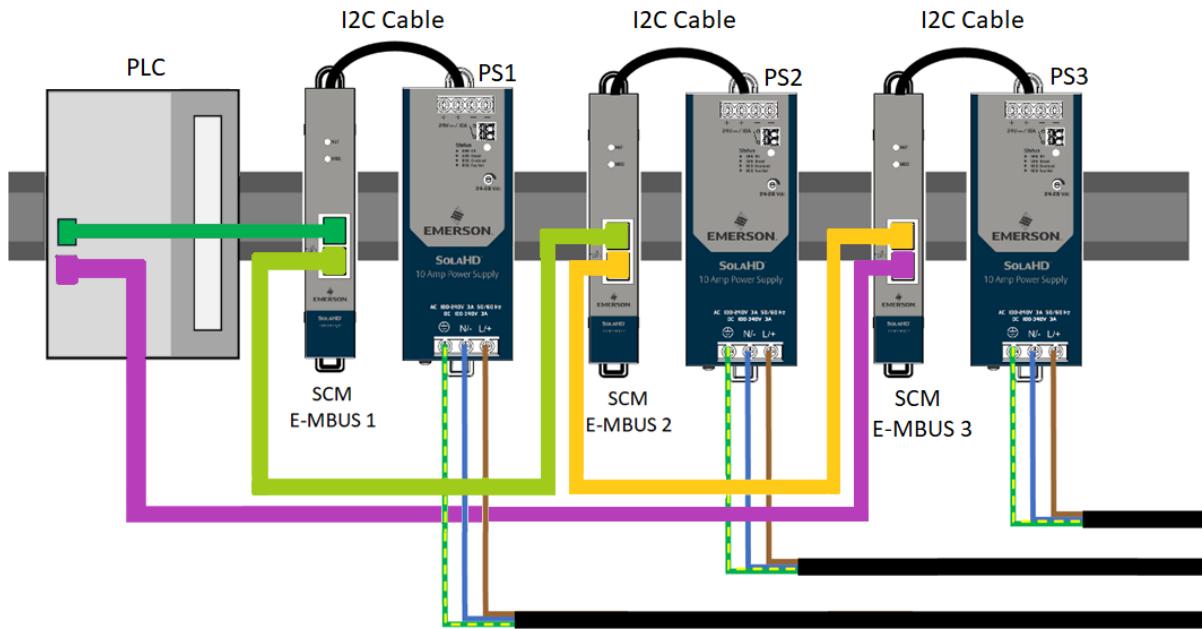

1.5.4.2 WIRING: PLC-MODBUS TCP CLIENT RING TOPOLOGY

The set-up below shows the wiring of a one SCM-E-MBUS and one SDN-D Power Supply to a PLC which support Modbus TCP client in ring topology.

Ring Connection of SCM-E-MBUS to PLC and Client/PC

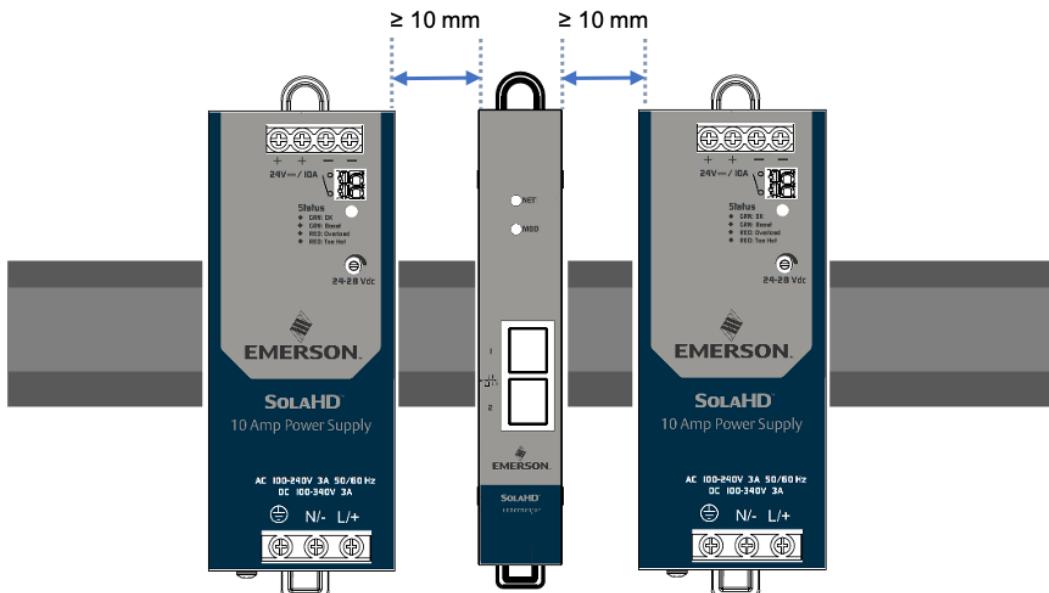

The set-up below shows the wiring of a three SCM-E-MBUS and three SDN-D Power Supply to a PLC which support Modbus TCP client in ring topology.

Ring Connection of three separate power supplies

1.5.5 SPACING

The setup below shows the spacing of the SCM-E-MBUS to the SDN-D Power Supplies. Please note that all devices are mounted on a standard DIN-rail.

1.6 ACCURACY PARAMETERS

The measurement and calculation data of accuracy as shown in table below. For full list of SCM parameters, please refer to [Section 4.3.1](#).

Parameter	Accuracy
SCM Temperature	+/-2.0°C
PS1 Vout	+/-2%
PS1 Iout	+/-2.5%
PS1 Vin	+/-5.0%
PS2 Vout	+/-2%
PS2 Iout	+/-2.5%
PS2 Vin	+/-5.0%

NOTES:

- The accuracy defined in the table above is valid over the entire operating input, load, Vout range and 0–60°C (unless specified otherwise)
- Iout accuracy at > 20% of max. operating load

Power supply stress indications are shown in table below.

Stress Indication	Description and Action
Green	Extended service life expected. Low thermal stress. No action needed.
Amber	Less optimal ambient temperature, and/or load combination. No risk of thermal overstress. Service life less than green stress mode, still high. Monitor load, line, and ventilation/air flow around power supply.
Red	High thermal stress. Reduced service life. Check load, mains (for low mains such as 90-105Vac ~) and ventilation/airflow for high ambient thermal conditions. Reduce load and/or improve ventilation.

1.7 EVENTS

The events shown below can be flagged through communication with SCM-E-MBUS.

Event	Event Code	Origin	Meaning
Short Circuit Protection	SCP/OCP	PSU	Short circuit fault occurred at the output of the power supply. This is triggered when the load current is greater than 150% of the rated load.
Overvoltage Protection	OVP	PSU	The output voltage of the power supply is greater than 32V.
Power Boost	PB	PSU	Power supply load which is less than 150% of the rated load but greater than 125% of the rated load.
Over Temperature Protection	OTP	PSU	Internal temperature of the power supply exceeding safe operating levels. This occurs when the main transformer temperature exceeds 125°C.
DC Status	DC OK	PSU	DC OK flag becomes active when output voltage > 22, and < 28.5 Vdc.
	DC NOT OK	PSU	DC Not OK flag becomes active when output voltage < 21.5 or > 29 Vdc.

Event	Event Code	Origin	Meaning
PSU Stress Level	Normal Medium High	PSU	Power supply stress level can be occurred in terms of Normal, Medium, and High. Refer to stress indication table in Section 1.6 .

1.8 PRODUCT INFORMATION AND DEFAULT COMM. CONFIGURATION

The communication configuration and product information shown below can be read through SCM-E-MBUS.

Name	Default Factory Settings	Process Data	CIP
Part Number	SCM-E-MBUS	None	Read
Serial Number ¹	...	None	Read
Manufacturing Info ¹	...	None	Read
Manufacturer Name	SolaHD	None	Read
Model Revision ¹	...	None	Read
Primary Revision ¹	...	None	Read
Secondary Revision ¹	...	None	Read
MAC Address ²	XX:XX:XX:XX:XX:XX	None	Read

¹ Factory dependent, no fixed value

² Specified as a unique identified.

Default Communication				
DHCP	Enabled	None	Read/Write	
IP Address	0.0.0.0	None	Read/Write	
Subnet Mask	0.0.0.0	None	Read/Write	
Gateway Address	0.0.0.0	None	Read/Write	
Host Name	Auto assigned		Read/Write	
Domain name	Auto assigned		Read/Write	
DNS Server #1	0.0.0.0	None	Read/Write	
DNS Server #2	0.0.0.0	None	Read/Write	
Port 1	User Configurable		Read/Write	
Port 2	User Configurable		Read/Write	

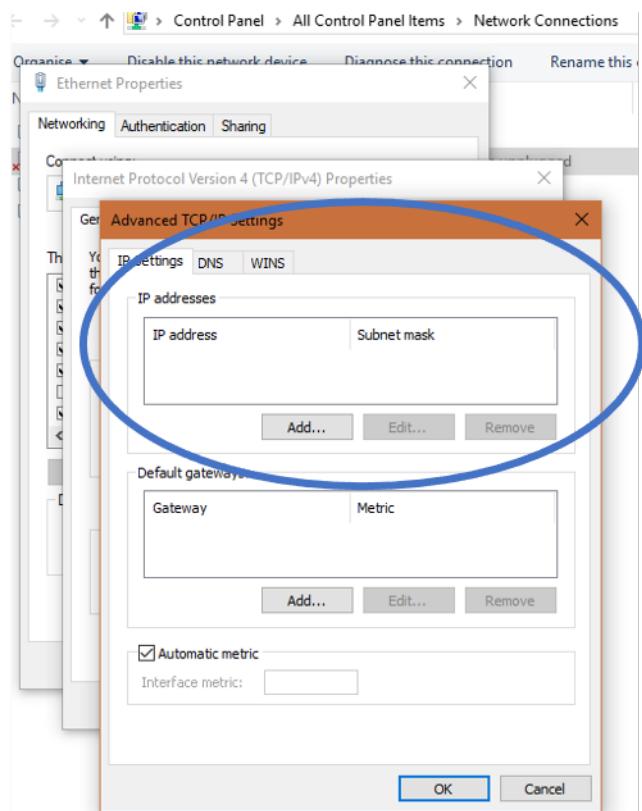

2. NETWORK CONFIGURATION/ IP SETTINGS

2.1 NETWORK CONFIGURATION

2.1.1 STATIC IP

The following example shows how to change to a Static IP Address of 192.168.1.5 from a PC connected on the network. Note that by default, SCM-E-MBUS is DHCP-enabled. If there is no DHCP server available, or the user doesn't want to use DHCP server, then it must be changed to Static. This can be done using the HMS IPConfig tool, described in the next section.

1. Go to Settings > Network and Internet > Change adapter options.
2. Right-click on your Local Area Network (LAN) and select Properties.
3. Click Internet Protocol Version 4 (TCP/IPv4)
4. Select "Use the following address" and click Advanced.
5. Add IP 192.168.1.5 and Subnet Mask 255.255.255.0

2.1.2 HMS IP CONFIG TOOL

HMS Ipconfig is a Windows-based tool for configuration of TCP/IP settings in HMS devices. Ipconfig will detect all compatible and active HMS devices on the local network. The devices do not have to be on the same Ethernet subnet as the computer running.

1. Click this [link](#) to download the IPConfig tool.
2. Select HMS IP Config – Utility for module TCP/IP configuration.
3. After the download is finished, unpack the items in the zip file and run the installer.
4. Connect the SCM-E-MBUS to the PC where you installed the HMS IP Config tool, preferably using a direct connection.
5. Follow the [HMS IPConfig User Guide](#).
6. Click Next until you reach the Registration process.

3. MONITORING

3.1 WEBSERVER MONITORING

3.1.1 PROCEDURE

The SCM-E-MBUS Communication Module comes with a webserver Graphical User Interface (GUI) that allows the user to monitor the different parameters and alarms from the device connected to it. It also allows the user to configure SCM-E-MBUS network settings such as IP address and net mask.

This webserver can be opened by most browsers such as Google Chrome, Microsoft Edge, Mozilla Firefox, Safari, etc.

To open the SCM webserver, follow the instructions below:

1. Set-up the wiring of the SCM-E-MBUS and the SOLAHD Power Supply. For information on the wiring setup of SOLAHD Power Supplies to the SCM-E-MBUS, refer to [Section 1.5.1](#).
2. Once the setup is finished, turn the devices on and configure the network. For instructions on how to configure the network, refer to [Section 2.1](#). If the network is already configured, skip this step.
3. To make sure that the SCM is really connected to the network, the user can ping the device using the IP address set in [Section 2.1](#). (e.g 192.168.1.5). Type "ping 192.168.1.5" at the command prompt. The Command Prompt can be opened by typing "cmd" in the Windows search bar and pressing **Enter**. (This step can be skipped.)
4. Once the connection is established, open the desired browser and type the IP address (192.168.1.5) in the address bar.
5. The webserver should be loaded with the default tab opened (Overview tab).

The screenshot shows the Emerson SOLAHD webserver interface. At the top, there are two logos: 'EMERSON' on the left and 'SOLAHD' on the right. Below the logos, the title 'OVERVIEW' is displayed. The main content area contains a table with four columns: 'SCM' and 'PS41' under the first column, and 'PS42' under the second column. The table rows provide detailed information about the components. At the bottom of the interface, there is a footer bar with the text 'The Emerson and SolaHD logos are registered trademarks. © 2024 EMERSON - All rights reserved'.

	Description	SCM	PS41	PS42
Part Number	SCM-E-MBUS	SDN 10-24-100D	SDN 10-24-100D	
Serial Number	22100175	N4773X001BCBC	N4773X001CCBC	
Manufacturing Info	22100175	PH27222048	PH27222049

Primary Revision	01	06	06	
Secondary Revision	01	09	09	

3.1.2 MENU HIERARCHY

The webserver is divided into three main tabs: Monitoring, System and Network. The Monitoring tab contains Overview, Parameters, Alarms, Events, and Trends. The Parameters tab contains Live Parameters, Counts and Max Values. The System tab contains Configuration, while the Network tab contains Status and Configuration.

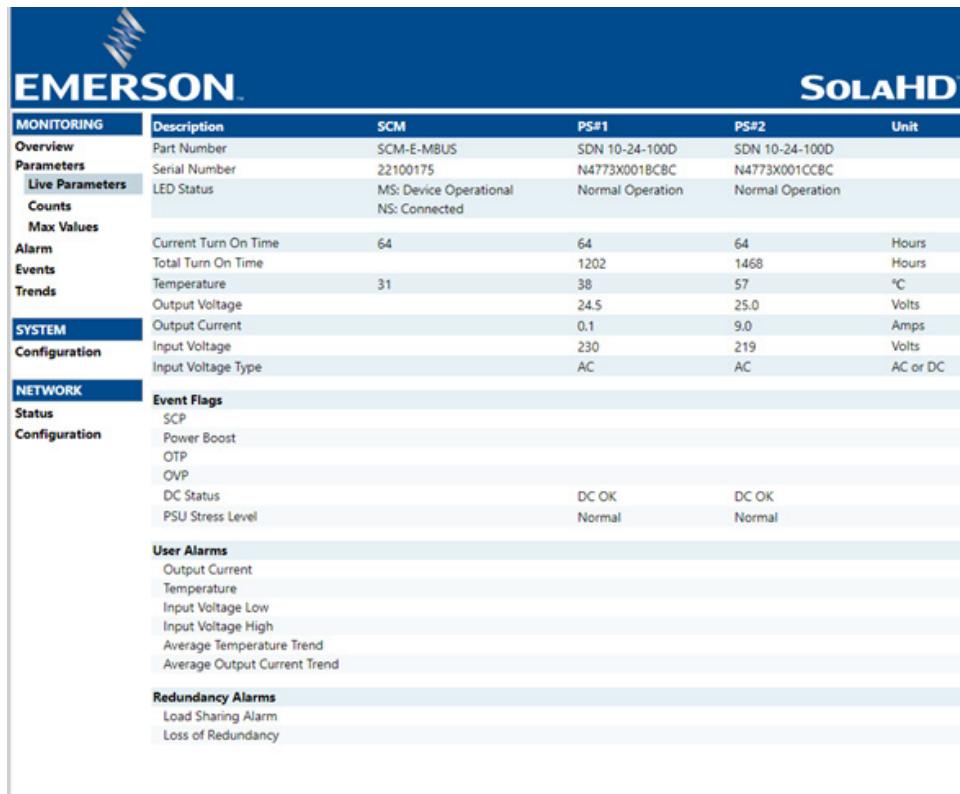

3.1.2.1 MONITORING TAB

The Overview tab shows the identification of the module attached to the network such as module name, serial number, firmware version, and uptime.

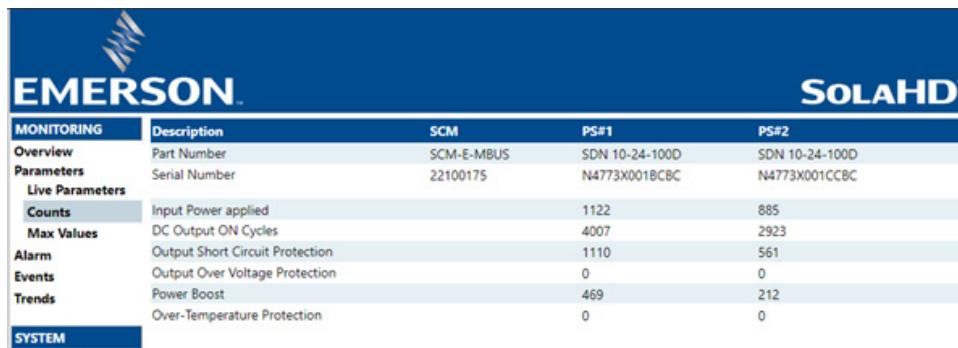

EMERSON SOLAHD				
MONITORING	Description	SCM	PS#1	PS#2
Overview	Part Number	SCM-E-MBUS	SDN 10-24-100D	SDN 10-24-100D
Parameters	Serial Number	22100175	N4773X001BCBC	N4773X001CCBC

	Temperature Time Stamp	85 °C	500 Hours	86 °C	910 Hours
SYSTEM					

The Alarm tab allows the user to set threshold values to the device through the GUI. The threshold values are stored in a non-volatile memory in the SCM Device.

MONITORING	Name	Threshold/Status	Value	Unit	
Overview	PS#1 Current High	200.0		Amps	<button>Update</button>
Parameters	PS#1 Temperature High	150		°C	<button>Update</button>
Live Parameters	PS#1 Input Voltage High	300		Volts	<button>Update</button>
Counts	PS#1 Input Voltage Low	50		Volts	<button>Update</button>
Max Values	PS#1 Current Change Threshold	100.0		%	<button>Update</button>
Alarm	PS#1 Alarm Enable/Disable	DisableSelect.....		<button>Update</button>
Events					
Trends	PS#2 Current High	200.0		Amps	<button>Update</button>
SYSTEM	PS#2 Temperature High	150		°C	<button>Update</button>
Configuration	PS#2 Input Voltage High	300		Volts	<button>Update</button>
NETWORK	PS#2 Input Voltage Low	50		Volts	<button>Update</button>
Status	PS#2 Current Change Threshold	100.0		%	<button>Update</button>
Configuration	PS#2 Alarm Enable/Disable	DisableSelect.....		<button>Update</button>
	SCM Temperature High	150		°C	<button>Update</button>
	SCM Average Temperature Limit	100.0		%	<button>Update</button>
	SCM Alarm Enable/Disable	DisableSelect.....		<button>Update</button>
	Redundancy Alarm Enable/Disable	DisableSelect.....		<button>Update</button>

The GUI allows the user to input preferred limits by pressing the Update button on the right side. The value will be immediately saved in the non-volatile memory.

Once the PS1 or PS2 | Enable Alarm value is set to Enabled, the firmware will start evaluating the live parameter periodically and check if the parameter exceeds the threshold limit.

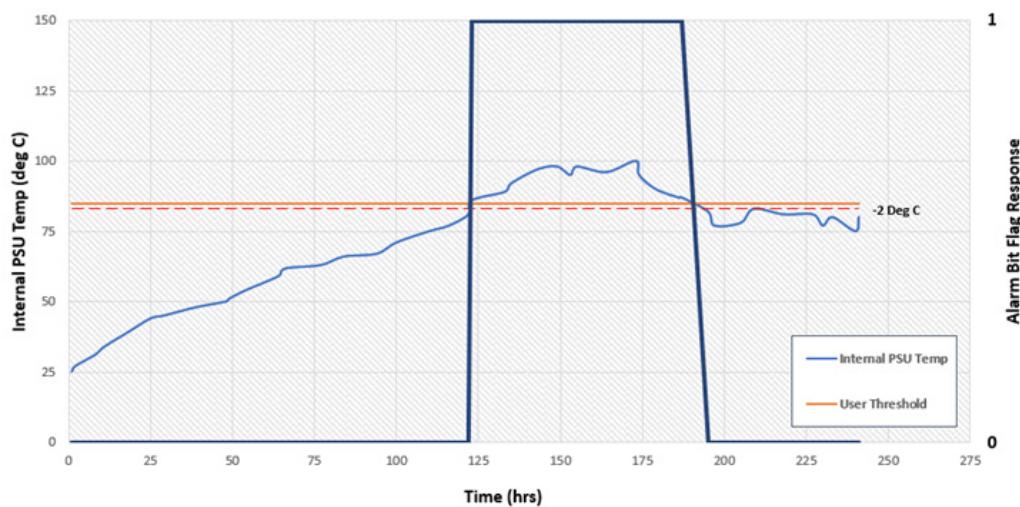

To prevent abrupt changes in the Alarm Bit Flag, hysteresis is added to the threshold. The setting for the hysteresis value is at $\pm 5\%$ of the threshold value (other than PSU temperature alarm). Initially the value of the bit flag is set to 0 upon startup of the device. The Bit Flag is set or reset if the value is above or below the hysteresis threshold.

PSU Temperature Alarm:

Recommended threshold is 85 Deg C for SDN-D 10A and SDN D 20A. This is maximum operating temperature (internal) of the power supply. The power supply can continue to operate beyond this threshold, with reduced service life, till shutdown occurs (auto-recoverable) due to internal over temperature protection. Hysteresis for PSU temperature alarm is 0 deg C, -2 deg C.

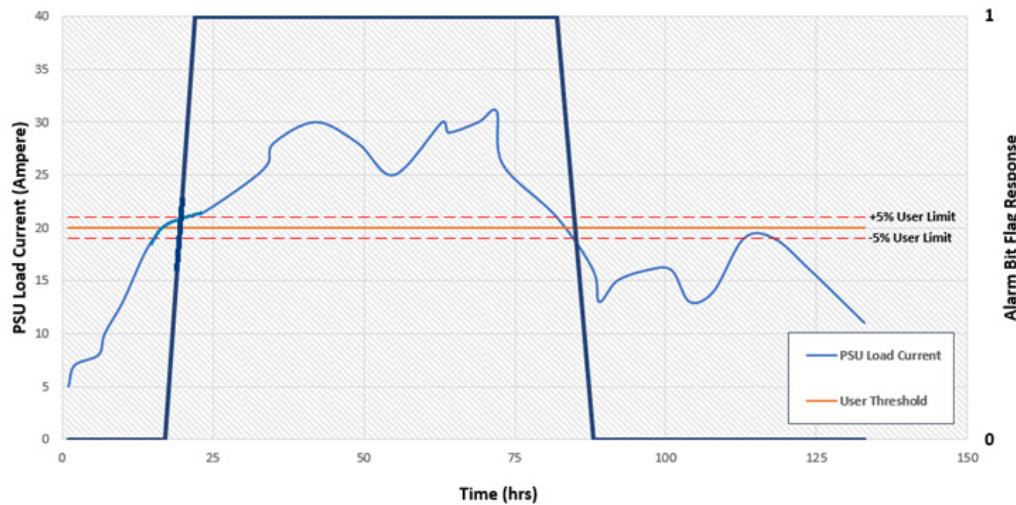

In the example below, the SDN-D 10A Internal PSU Temperature Alarm is set to 85 deg C. The alarm bit will be set to 1 when the temperature is greater than 85 deg C. The alarm bit will be set to 0 when the temperature is less than or equal to 83 deg C (hysteresis).

PSU Temperature Alarm Flag Response with -2 Hysteresis

In another example below, the PSU Current High Alarm is set to 20A. With 5% hysteresis, or 1A, the alarm bit will be set to 1 when the load current is equal to or greater than 21A. The alarm bit will be set to 0 when the temperature is less than or equal to 19A.

Alarm Flag Response with $\pm 5\%$ Hysteresis

The following table provides the allowable range for settable fields in the User Configurable Alarms. In case of SDN or SCM Temperature, the user needs to enter threshold depending on unit configured either in Fahrenheit or in Celsius from system configuration tab (refer to [Section 3.1.2.2](#)). The system will adjust the minimum and maximum values accordingly.

Parameter	Range		
	Min	Max	Units
SDN Current High	0	200	Amps
SDN Temperature High (°C)	-50	+150	Deg C
SDN Temperature High (°F)	-58	+302	Deg F
SDN Input Voltage High	140	300	V
SDN Input Voltage Low	50	200	V
SDN Average Output Current Change	0	100	%
SCM Temperature High (°C)	-50	+150	Deg C
SCM Temperature High (°F)	-58	+302	Deg F
SCM Average Temperature Limit	0	100	%

The user configurable Alarm Flags can be monitored according to the two tables below. Currently, only Bits 0-4 are used. The other bits are reserved for future functionality.

If an alarm limit is exceeded, the corresponding Bit position in the 32-bit Alarm Flag becomes High.

Bit Number	Bits 5-31	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0
Description	"0 (reserved for future use)"	Average Current High > Threshold	Internal Temperature > Threshold	Output Current > Threshold	Input Voltage Low > Threshold	Input Voltage High > Threshold

Avg Current High	Internal Temp High	Output Current High	Input Voltage Low	Input Voltage High	Register Value
≤ Threshold	≤ Threshold	≤ Threshold	≤ Threshold	≤ Threshold	0x00000000
≤ Threshold	≤ Threshold	≤ Threshold	≤ Threshold	> Threshold	0x00000001
≤ Threshold	≤ Threshold	≤ Threshold	> Threshold	≤ Threshold	0x00000002
≤ Threshold	≤ Threshold	≤ Threshold	> Threshold	> Threshold	0x00000003

Enabling/Disabling Alarm Flags:

The alarm flag for each PSU, SCM and for Redundancy can be enabled or disabled according to user needs. If the ENABLE ALARM is disabled, the SCM-E-MBUS ignores the value set in the threshold value and always returns a 0x0000 value in the alarm flag.

Name	Threshold/Status	Value	Unit	Update
PS#1 Current High	200.0		Amps	Update
PS#1 Temperature High	150		°C	Update
PS#1 Input Voltage High	300		Volts	Update
PS#1 Input Voltage Low	50		Volts	Update
PS#1 Current Change Threshold	100.0		%	Update
PS#1 Alarm Enable/Disable	Disable	-----Select-----		Update
PS#2 Current High	200.0		Amps	Update
PS#2 Temperature High	150		°C	Update
PS#2 Input Voltage High	300		Volts	Update
PS#2 Input Voltage Low	50		Volts	Update
PS#2 Current Change Threshold	100.0		%	Update
PS#2 Alarm Enable/Disable	Disable	-----Select-----		Update
SCM Temperature High	150		°C	Update
SCM Average Temperature Limit	100.0		%	Update
SCM Alarm Enable/Disable	Disable	-----Select-----		Update
Redundancy Alarm Enable/Disable	Disable	-----Select-----		Update

The Events tab shows all flagged alarms, their corresponding code, and description. It also contains a download button to save the flagged events to a csv file.

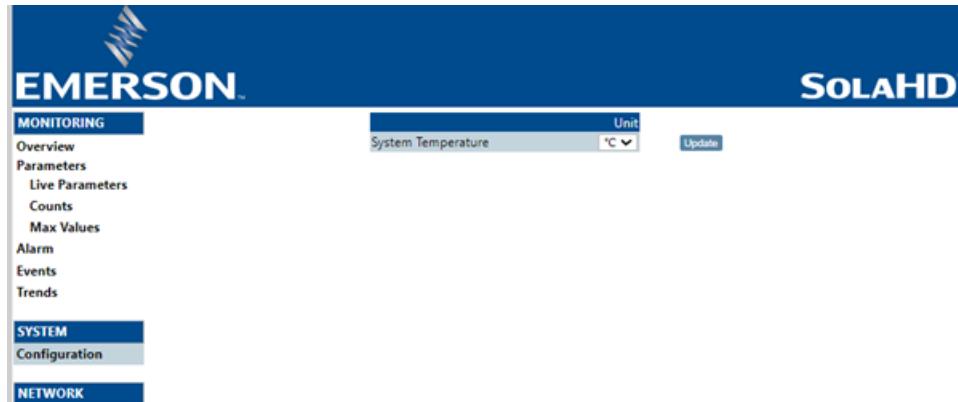

Description	Event Code	Event Start/End	Timestamp (Hrs)
PS#1 Event Data 1	Over Temperature Protection	End	2172
PS#1 Event Data 2	Power Boost	End	2172
PS#1 Event Data 3	Over Voltage Protection	End	2172
PS#1 Event Data 4	Short Circuit Protection	End	2172
PS#1 Event Data 5	Over Temperature Protection	Start	2172
PS#1 Event Data 6	Power Boost	Start	2172
PS#1 Event Data 7	Over Voltage Protection	Start	2172
PS#1 Event Data 8	Short Circuit Protection	Start	2172
PS#1 Event Data 9	Over Temperature Protection	End	2131
PS#1 Event Data 10	Power Boost	End	2131

The Trends tab shows last hour and 24 hours averaging calculation data of SCM temperature and SDN-D power supplies output current.

Last hour Average	Previous Hourly Average																			
	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20
SCM Average Temperature('F)	88	86	86	86	86	84	86	86	84	86	84	86	84	84	84	84	84	84	84	84
PS#1 Average Output Current(Amps)	0.1	0.1	0.1	0.1	0.1	0.1	0.1	0.1	0.1	0.1	0.1	0.1	0.1	0.1	0.1	0.1	0.1	0.1	0.1	0.1
PS#2 Average Output Current(Amps)	9.0	7.6	0.3	0.3	0.3	0.3	0.3	0.3	0.3	0.3	0.3	0.3	0.3	0.3	0.3	0.3	0.3	0.3	0.3	0.3

3.1.2.2 SYSTEM TAB

The Configuration tab allows the user to set system temperature unit to either Fahrenheit or Celsius to the device through the GUI. The unit set is stored in a non-volatile memory in the SCM Device.

3.1.2.3 NETWORK TAB

The Status tab shows the status of the network, such as its current IP settings and current Ethernet status.

The Configuration tab allows the user to change current IP configuration such as the IP address, subnet mask, gateway address, and DNS servers. By changing this configuration, the SCM Module will lose the existing connection. The DHCP configuration can also be changed in this tab. **NOTE:** A power cycle or Type 0 Reset is required for the changes in IP configuration to take effect.

4. REGISTER MAP

The SCM-E-MBUS data map explains the information and parameters accessible using the Modbus protocol.

4.1 DATA FORMAT AND READ/WRITE EXAMPLES

The bytes order of data format in Modbus response is little endian system. The supported data format is shown in the table below:

Datatype	Description
UINT8	Unsigned 8-bit means 1 byte and packed 2 bytes per register in high-low order.
SINT16/UINT16	16-bit signed/unsigned integer occupy per register.
SINT32/UINT32	32-bit signed/unsigned integer spanning 2 registers consecutively. The lower-addressed register is the high order half.
FLOAT	32-bit IEEE floating point number spanning 2 registers consecutively. The lower-addressed register is the high order half.

4.1.1 COMMAND AND RESPONSE EXAMPLES

The example shown below in [Section 4.1.1.1](#) describes typical command and response frame structure in Modbus TCP protocol.

4.1.1.1 READ FIXED/FRU DATA

Example: How to Read SCM Part Number - SCM Part Number parameter data type is UINT8 format, and Register address is 0xA441.

- Offset Address : 0x0800.
- Function Code : 0x03
- Number of registers: 0x0008 (Because parameter size is 16 bytes)

Request Structure:

Trans. ID		Protocol ID		Length		Unit ID	Function Code	Address Reg.		No. of read Reg.	
Hi Byte	Lo Byte	Hi Byte	Lo Byte	Hi Byte	Lo Byte			Hi Byte	Lo Byte	Hi Byte	Lo Byte
00	00	00	00	00	00	00	03	08	00	00	08

NOTES:

- Trans. ID, Protocol ID, Length, Unit ID it set by Master. All data in this table represented in hex format.
- In response data bytes order is little endian system.

Response Structure:

Function Code	Number of Bytes	Value of Registers Sequence															
		1		2		3		4		5		6		7		8	
03	10	Hi	Lo	Hi	Lo	Hi	Lo	Hi	Lo	Hi	Lo	Hi	Lo	Hi	Lo	Hi	Lo

Data: 0x53434D2D452D4D425553202020202000, Converted to ASCII = “SCM-E-MBUS”

Error Response

Trans. ID		Protocol ID		Length		Unit ID		Function Code		Exception Code	
Hi Byte	Lo Byte	Hi Byte	Lo Byte	Hi Byte	Lo Byte	00		83		XX*	
00	00	00	00	00	00						

Where the exception response's exception function code is the same as the original request function code plus 128 (0x83).

*Refer to [Section 4.2](#) for a list of possible exception codes.

4.1.1.2 READ INT16 DATA FORMAT

Example: How to Read SCM Part Temperature - SCM Temperature parameter data type is INT16 format, and Register address is 0xA45B.

- Offset Address : 0x081A
- Function Code : 0x03
- Number of registers : 0x0001 (Because parameter size is 2 bytes)

Request Structure:

Trans. ID		Protocol ID		Length		Unit ID	Function Code	Address Reg.		No. of read Reg.	
Hi Byte	Lo Byte	Hi Byte	Lo Byte	Hi Byte	Lo Byte			Hi Byte	Lo Byte	Hi Byte	Lo Byte
00	00	00	00	00	00	00	03	08	1A	00	01

Response Structure:

Function Code	Number of Bytes	Value of Register			
		1			
03	02	Hi Byte		Lo Byte	
		00		21	

Data = 0x0021 = 33°C (INT16)

Error Response

Trans. ID		Protocol ID		Length		Unit ID	Function Code	Exception Code
Hi Byte	Lo Byte	Hi Byte	Lo Byte	Hi Byte	Lo Byte			
00	00	00	00	00	00	00	83	XX*

*Refer to [Section 4.2](#) for a list of possible exception codes.

4.1.1.3 READ UINT32 DATA FORMAT

Example: How to Read SCM Turn ON Time - SCM Turn ON Time parameter data type is UINT32 format, and Register address is 0xA459.

- Offset Address : 0x0818
- Function Code : 0x03
- Number of registers : 0x0002 because parameter size is 4 bytes.

Request Structure:

Trans. ID		Protocol ID		Length		Unit ID	Function Code	Address Reg.		No. of read Reg.	
Hi Byte	Lo Byte	Hi Byte	Lo Byte	Hi Byte	Lo Byte			Hi Byte	Lo Byte	Hi Byte	Lo Byte
00	00	00	00	00	00	00	03	08	18	00	02

Response Structure:

Function Code		Number of Bytes		Value of Registers			
				1		2	
03		04		Hi Byte	Lo Byte	Hi Byte	Lo Byte
				16	AB	00	00

Data = 0x000016AB = 5803 Seconds (UINT32)

Error Response

Trans. ID		Protocol ID		Length		Unit ID	Function Code	Exception Code
Hi Byte	Lo Byte	Hi Byte	Lo Byte	Hi Byte	Lo Byte			
00	00	00	00	00	00	00	83	XX*

*Refer to [Section 4.2](#) for a list of possible exception codes.

4.1.1.4 READ FLOAT DATA FORMAT

Example: How to Read PS1 Output Voltage - PS1 output voltage parameter data type is FLOAT format, and Register address is 0xA4C7.

- Offset Address : 0x0886
- Function Code : 0x03
- Number of registers : 0x0002 because parameter size is 4 bytes.

Request Structure:

Trans. ID		Protocol ID		Length		Unit ID	Function Code	Address Reg.		No. of read Reg.	
Hi Byte	Lo Byte	Hi Byte	Lo Byte	Hi Byte	Lo Byte			Hi Byte	Lo Byte	Hi Byte	Lo Byte
00	00	00	00	00	00	00	03	08	86	00	02

Response Structure:

Function Code		Number of Bytes		Value of Registers			
				1		2	
03		04		Hi Byte	Lo Byte	Hi Byte	Lo Byte
99	9A	41	C1				

Data = 0x41C1999A = 24.2 V (FLOAT)

Error Response

Trans. ID		Protocol ID		Length		Unit ID	Function Code	Exception Code	
Hi Byte	Lo Byte	Hi Byte	Lo Byte	Hi Byte	Lo Byte			XX*	XX*
00	00	00	00	00	00	00	83		

Where the exception response's exception function code is the same as the original request function code plus 128 (0x86).

*Refer to [Section 4.2](#) for a list of possible exception codes.

4.1.1.5 WRITE USER ALARM CONFIG DATA

Example: How to Write SCM Temperature High User Configurable Limit - SCM temperature high parameter data type is INT16 format, and Register address is 0xB1FD.

- Offset Address : 0x15BC
- Function Code : 0x06 to write single register.
- Data Value : 0x0032 (50°C), (Make sure this value is within specified range)

Request Structure:

Trans. ID		Protocol ID		Length		Unit ID	Function Code	Address Reg.		No. of read Reg.	
Hi Byte	Lo Byte	Hi Byte	Lo Byte	Hi Byte	Lo Byte			Hi Byte	Lo Byte	Hi Byte	Lo Byte
00	00	00	00	00	00	00	06	15	BC	00	32

Response Structure:

Function Code		Number of Bytes		Value of Register			
				1	Hi Byte	Lo Byte	00
03		02					32

Data = 0x0032 = 50°C (INT16)

Error Response

Trans. ID		Protocol ID		Length		Unit ID	Function Code	Exception Code	
Hi Byte	Lo Byte	Hi Byte	Lo Byte	Hi Byte	Lo Byte			00	86
00	00	00	00	00	00				XX*

Where the exception response's exception function code is the same as the original request function code plus 128 (0x86).

*Refer to [Section 4.2](#) for a list of possible exception codes.

4.2 EXCEPTION CODES

The following table describes supported exception codes. If one of these codes is received in a Modbus request, it means an error has occurred.

Code	Name	Description
0x01	Illegal function	The function code in the query is not supported by the Modbus server.
0x02	Illegal data address	The data address received in the query is outside the initialized memory area. If invalid or out of range, register address sends in Modbus query.
0x03	Illegal data value	The data in the request is illegal. It may be out of range of supported datatype.

4.3 HOLDING AND INPUT REGISTER PARAMETERS LIST

Holding register address list can be read using function code 03 as (4X) registers. For example, to read “SCM Temperature” parameter, the address in decimal column from below table is 42075 – 40001 = 2074 as the starting register address. Refer to [Section 4.1.1.2](#) to see example.

Similarly, Input register address list can be read using function code 04 as (3X). For example, to read “SCM Temperature” parameter, the address in decimal column from below table is 30027 – 30001 = 26 as the starting register address.

4.3.1 FIXED DATA AND REALTIME DATA POINTS LIST

The measurement and calculation data shown below can be read using function code 03 and function code 04 through the SCM-E-MBUS. The full list of SCM parameters is shown in the table below:

Modbus Address (4X-Holding)		Modbus Address (3X-Input)		Parameters	Access	Datatype	Size	Range	Units	Comments
Decimal	Hex	Decimal	Hex							
SCM Parameters										
42049	A441	30001	7531	SCM Part Number	R	UINT8	16			SCM-E-MBUS

4.3.2 USER CONFIGURABLE ALARMS LIMIT DATA SET PONITS LIST

The user configurable alarms limit can be set by using function code 06 and read back by using function code 03. Refer to [Section 4.1.1.5](#) to see an example.

4.3.4 SCM LED STATUS DETAIL

Module LED State	Network LED State	Decimal Value	Hex Value
No Power	No IP Address	00	00
Device Operational	No IP Address	32	20
Device Operational	No Connection	33	21
Device Operational	Connected	34	22
Device Operational	Connection Timeout	36	24
Device Operational	Duplicate IP	40	28
Major Recoverable Fault	No IP Address	64	40
Major Recoverable Fault	No Connection	65	41
Major Recoverable Fault	Connected	66	42
Major Recoverable Fault	Connection Timeout	68	44
Major Recoverable Fault	Duplicate IP	72	48
Major Unrecoverable Fault	No IP Address	128	80
Major Unrecoverable Fault	No Connection	129	81
Major Unrecoverable Fault	Connected	130	82
Major Unrecoverable Fault	Connection Timeout	132	84
Major Unrecoverable Fault	Duplicate IP	136	88

4.3.5 POWER SUPPLY LED STATUS DETAIL

Power Supply LED Indicator	Meaning	Decimal Value	Hex Value
Green Steady	Normal Operation	1	01
Green Blinking	Heavy Load	5	05
Green Blinking, Red Blinking (alternating)	Power Boost	6	06
Red Blinking	Short Circuit or Overtemperature Protection	4	04
Red Steady	Over Voltage Protection	2	02
Off	No DC Output	0	00

4.3.6 EVENT DATA VALUE DEFINITION

4.3.6.1 EVENT CODE DEFINITION

Register Value	Event Code
0x0008	Short Circuit Protection
0x0009	Reserved
0x000A	Over Voltage Protection
0x000B	Power Boost
0x000F	Over Temperature Protection
0x00FF	No Event

4.3.6.2 EVENT START DEFINITION

Register Value	Event Start
0	End
1	Start
1	No Event (Refer to Event Code)

4.3.6.3 EVENT TIMESTAMP DEFINITION

Register Values				Conversion	
Register 1		Register 0		Hex	Dec (seconds)
High Byte	Low Byte	High Byte	Low Byte		
0xC8	0x89	0x00	0x00	0x000089C8	35,272

4.4 INPUT STATUS (DISCRETE INPUTS) REGISTER PARAMETERS LIST

Supported Alarms, also mapped to Input status register parameters list, can be read using function code 02 as (1X) registers. For example, to read “SCM | High Ambient Temperature” parameter, the address in decimal column from table below is 18001 – 10001 = 8000 as the starting register address.

The input status registers data value is single bit response (1 or 0 only). 1 = Alarm ON and 0 = Alarm OFF. Refer to table below for parameters list.

Modbus Address		Parameters	Access
Decimal	Hex		
18001	4651	SCM High Ambient Temperature	R
18002	4652	SCM Average Ambient Temperature	R
18003 -18033	4653 -4671	Reserved	R

Modbus Address		Parameters	Access
Decimal	Hex		
18034	4672	PS1 Short Circuit Protection	R
18035	4673	Reserved	R
18036	4674	PS1 Over Voltage Protection	R
18037	4675	PS1 Power Boost	R
18038	4676	Reserved	R
18039	4677	PS1 Over Temperature Protection	R
18040	4678	PS1 Power Down	R
18041 -18049	4679 -4681	Reserved	R
18050	4682	PS2 Short Circuit Protection	R
18051	4683	Reserved	R
18052	4684	PS2 Over Voltage Protection	R
18053	4685	PS1 Power Boost	R
18054	4686	Reserved	R
18055	4687	PS2 Over Temperature Protection	R
18056	4688	PS2 Power Down	R
18057 -18064	4689 -4690	Reserved	R
18065	4691	PS1 Input Voltage High	R
18066	4692	PS1 Input Voltage Low	R
18067	4693	PS1 Output Current High	R
18068	4694	PS1 Internal Temperature High	R
18069 -18096	4695 -46B0	Reserved	R
18097	46B1	PS2 Input Voltage High	R
18098	46B2	PS2 Input Voltage Low	R
18099	46B3	PS2 Output Current High	R
18100	46B4	PS2 Internal Temperature High	R
18101 -18128	46B5 -46D0	Reserved	R
18129	46D1	RED Load Sharing Alarm	R
18130	46D2	RED Loss of Redundancy	R
18131 -18160	46D3 -46F0	Reserved	R
18161	46F1	PS1 DC NOT OK	R
18162 -18176	46F2 -4700	Reserved	R
18177	4701	PS2 DC NOT OK	R
18178 -18192	4702 -4710	Reserved	R
18193	4711	PS1 Medium Stress Level	R
18194	4712	PS1 High Stress Level	R
18195 -18208	4713 -4720	Reserved	R
18209	4721	PS2 Medium Stress Level	R

Modbus Address		Parameters	Access
Decimal	Hex		
18210	4722	PS2 High Stress Level	R
18211 -18224	4723 -4730	Reserved	R

5. TROUBLESHOOTING

5.1 TROUBLESHOOTING

Problem	Possible Cause	Solution
Module and Network LED indicators are off.	Loose connection. The I2C cable connecting SCM-E-MBUS to the power supply isn't connected properly.	Check connection between SCM-E-MBUS and power supply. Make sure the cables are inserted into their corresponding headers properly.
	No power connection. Problems with connected SDN-D power supply.	Check SDN-D status LED, wiring, and input power for proper operation.
Module LED indicator is steady green, but Network LED is OFF.	The SCM-E-MBUS is in DHCP Configuration but there is no DHCP server present in the network.	Disable the SCM-E-MBUS. Enable DHCP. Enable Configuration, if applicable.
	The SCM-E-MBUS is in DHCP Configuration and there is DHCP server present in the network.	Check if the network cable is correct and check for loose connection or break in continuity in the cable. Verify the SCM-E-MBUS's MAC address shows in the DHCP application and check if the SCM-E-MBUS is registered in the DHCP.
Module LED indicator is steady red.	Static IP Address has not been configured or is not properly configured.	The configured static IP Address does not belong to the network subnet. Check the SCM-E-MBUS IP Address and Subnet Mask and correct. Refer to Section 2.1.2 .
	Major Unrecoverable Fault.	Perform power cycle. If issue persists, contact technical support.
Module LED indicator is blinking red.	One of the PSUs connected to the SCM-E-MBUS encountered a major recoverable fault.	Check the status of the SDN-D power supplies connected to the SCM and correct any issues.

Problem	Possible Cause	Solution
IO Fault or Messaging Error on PLC; Network LED indicator is blinking red.	The Modbus TCP Messaging Connection between SCM and PLC has timed out.	Check the configuration on the PLC to ensure the IP address is correct, and the network connection with the SCM is good. Verify there are not multiple Modbus TCP connections.
Network error; Network LED indicator is steady red.	The SCM-E-MBUS has a duplicate IP Address within the network.	Disconnect the SCM-E-MBUS from the network. Connect to a Private LAN and reconfigure the IP Address.
Unable to load GUI; Network LED indicator is blinking or steady green.	The browser application or the PC network connection might have encountered an error. The SCM-E-MBUS might have entered a hang up state or the internal filesystem has been damaged or corrupted.	Verify correct IP address, restart the browser and check if the GUI will show up. Restart the PC if the problem persists. Restart the SCM-E-MBUS. If problem persists, contact technical support.
The GUI logo and format is not Emerson.	The SCM-E-MBUS internal filesystem has been damaged or corrupted	Contact technical support.
The SDN-D Power Supply data does not show up on the GUI or on the PLC.	SDN-D Power Supply and/or SCM-E-MBUS might be in a fault state.	Restart the affected SDN-D Power supply. If problem persists, restart the SCM-E-MBUS. If problem persists, contact technical support.

The information in this manual is provided as a guide for installation, operation, and maintenance. It does not affect or exceed our obligations under the Terms and Conditions of Sale.

Note that unit specifications are subject to change without notice.

TECHNICAL SUPPORT
